# Fire and Fire Risk Detection Solutions

With cameras operating in the field continuously 24/7 for more than ten years, Opgal's fire detection solution has proven reliable and robust; designed with you, the customer, in mind. The fire detection and risk of fire algorithms ensure your assets and personnel receive adequate warning of potential fire threats.

These alerts ensure enough time to react and avoid potential dangers from a devastating incident. Opgal's cameras are equipped with multiple alert options ensuring you can effectively integrate these solution into your existing equipment with minimal infrastructure.

Will **YOUR** project be next?

## Key Benefits

### Fire / Hot-Spot Detection

Detects fires and hot spots without smoke, from a few meters up to 6km, day or night.

### Multiple Alarm Types

Visual, Serial, TCP/IP, ONVIF and Contact Closure alarms signal an alarm state.

### Proprietary FD Algorithm

Flame behavior analysis for accurate identification and zero false alarms.

### Versatility

Can be used simultaneously for fire detection, security and monitoring.

### Multiple Lens Options

A wide range of lens options to ensure effective coverage for all projects.

### Rugged Design

Ruggedly designed to withstand the harshest environmental conditions.

### Quick Time to Detect

From 2-10 seconds, dependant on the application.

### Unlimited Detection

The camera can detection an unlimited number of events.

## Active Fire Detection

The Fire Detection algorithm detects and identifies a nearly unlimited number fire sources while avoiding false alarms.

The camera requires a minimum of 2 seconds to detect flames. The Fire Detection algorithm accurately identifies large fires at up to 6km in the longest range configuration.

When implemented in the Accuracii camera, one system can monitor several preset locations.

## Risk of Fire

The High Risk of Fire algorithm (also called Hot Spot Detection) examines a scene to determine which pixels have exceeded a user-defined temperature threshold.

Once set it highlights the area that exceeds the threshold in red.

Moving hot-spots, such as an object on a conveyor belt, are clearly identified for a quick response.

## Specifications Overview

**Imager Type**  
Uncooled 17μ  
8-14μm

**Sensitivity**  
NETD: <50°mK

**Fire Detection**  
Flame behavior analysis &  
hotspot detection

**Thermal Resolution**  
640 x 480

**Lens Options (mm)**  
8.5, 14.2, 19, 25, 35,  
60, 45/135

**Time to Detect**  
Hot Spot: Immediate  
Fire: 2 seconds of  
continuous detection

## Typical Applications

**Recycling  
Waste Management**

**Historic Town and  
City Surveillance**

**Remote Electric Substations**

**Oil & Gas Pipelines**

**Railway Stations  
and Tunnels**

**Industrial & Commercial  
Zones**

**Port Security**

**Critical  
Infrastructure**

**Storage Warehouses**
